

The table top mounts onto the top of the legs using the same size screws as are used in the bottom shelf holes. The stringers that hold the two legs together mount onto the legs using the same hardware that is used on the adjusters,— this hardware consists of 2" long bolts with 1/4" nuts, lock washers, and flat washers.

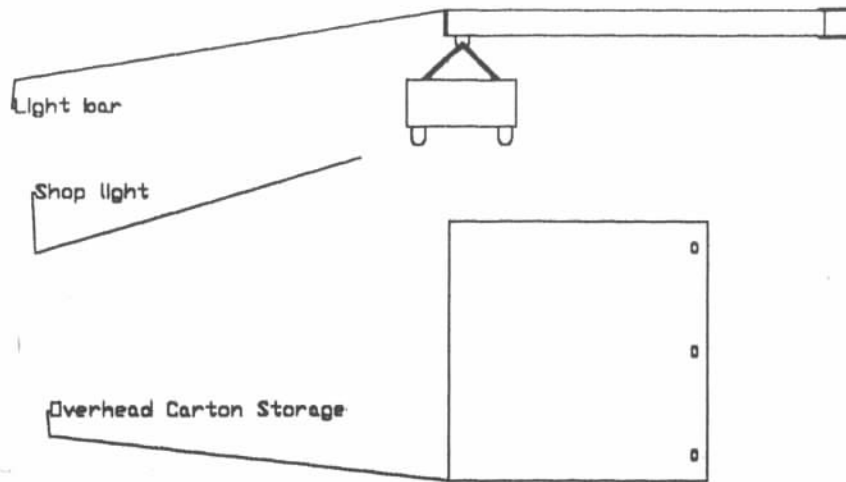

Lower shelf will mount on the lower spreader using the 1" long screws supplied in the hardware pack.

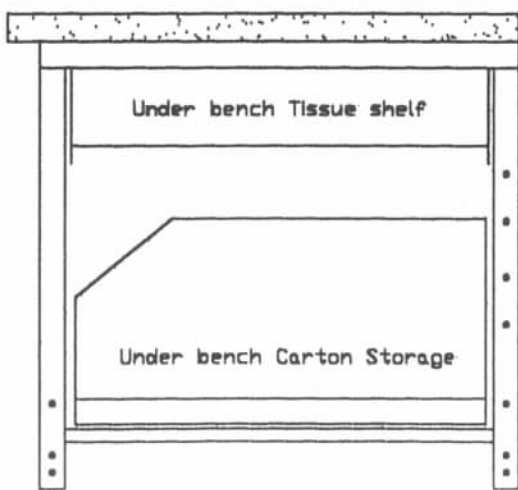

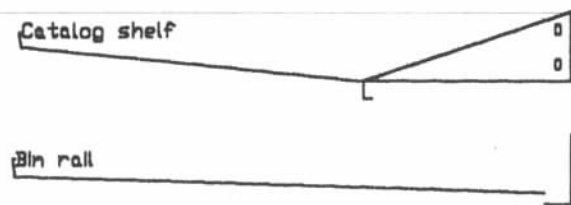

## Double Stringer Work Bench

Caster mounts are bolted to the leg upright using the 2" long bolts, nuts, and washers provided— The caster is a stem caster it needs to be threaded into the bottom of the adjuster then attached to the leg upright. On a non-adjustable Ht. bench, the caster screws directly into the bottom of the leg where a threaded part will be welded in place.

Light Standard Upright

The Overhead Carton Storage, Catalog shelf and Bin rail all are attached to the Upright using the Hardware that is sent along with each item in its own package all three use bolts, flat washers for each side of the tube, lock washers, and nuts. Each Item will have its own hardware. The overhead frame should be completely assembled to the legs and bench using the 2 1/2" long bolts provided before attaching the upper components to it. The shop light if purchased, should be placed on the ends of the short tubes that mount facing the bench on the upper connecting tube with the small chains and hooks that are sent in the light box. For best results the light fixture should be placed on the frame after all other assembly is complete.
